PAVING MATERIAL

Pavement Surface Coatings

ENDURABLEND™
POLYMER CEMENT SURFACING

Endurablend is ideally suited for crosswalks due to:

- Superior bond – Encapsulates asphalt to prevent raveling and protects existing concrete to retard erosion and scaling. Significantly less likely to delaminate than bituminous or epoxy surface coatings, which do not effectively bond to concrete, for longer-term performance.
- Durability – Thermally compatible with asphalt and concrete and less likely to delaminate. Accepts the most common striping and painting materials without adverse effects.
- Freeze-thaw resistance – Seals and waterproofs; fully resistant to de-icing salt treatments or salt scaling up to 50 cycles, an industry standard.
- Fuel and chemical-resistance – Withstands the corrosive effects of oils, fuels and de-icing agents.
- Aesthetics – Available in 12 standard colors that meet government and/or LEED® certification specifications; colors can be modified to match customer requirements as well. Because the pigment is integrated within the dry product prior to arrival at the job site, surface color treatments are more uniform across the job, wear better and last longer.
